“Serverless” is just a name. We could have called it “Jeff”

I am increasingly frustrated by people who keep complaining about the name “Serverless” for the architecture the community is creating. It’s just a name. We’ve survived with stupid names for architectures and stupid names for frameworks for a long time. It’s just a name. It actually might be more descriptive than most others! (Read this blog for a bit of context about what I think serverless is)

https://serverless.zone/serverless-is-just-a-name-we-could-have-called-it-jeff-1958dd4c63d7

Serverless Architectures

Serverless architectures refer to applications that significantly depend on third-party services (knows as Backend as a Service or "BaaS") or on custom code that's run in ephemeral containers (Function as a Service or "FaaS"), the best known vendor host of which currently is AWS Lambda. By using these ideas, and by moving much behavior to the front end, such architectures remove the need for the traditional 'always on' server system sitting behind an application. Depending on the circumstances, such systems can significantly reduce operational cost and complexity at a cost of vendor dependencies and (at the moment) immaturity of supporting services.

Mike Roberts

Mike is an engineering leader living in New York City. While spencing much of his time these days managing people and teams he also still gets to code occasionally, especially in Clojure, and has Opinions about software architecture. He is cautiously optimistic that Serverless architectures may be worth some of the hype that they are currently receiving.

REDUCING MAINTENANCE

AWS Lambda

Run code without thinking about servers.
Pay for only the compute time you consume.

Get started

Author a Lambda function from scratch, or choose from one of many preconfigured examples.

Create a function

Select blueprint

Blueprints are sample configurations of event sources and Lambda functions. Choose a blueprint that best aligns with your desired scenario and customize as needed, or click on **Author from scratch** if you want to author a Lambda function and configure an event source separately. Except where otherwise noted, blueprints are licensed under CC0.

Welcome to AWS Lambda! You can get started on creating your first Lambda function by choosing one of the blueprints below.

Configure triggers

You can choose to add a trigger that will invoke your function.

Welcome to AWS Lambda! You can get started on creating your first Lambda function by choosing one of the blueprints below.

Add trigger

Remove

DynamoDB table

Please select a DynamoDB table. The Lambda function will be invoked whenever this table is updated.

Batch size

The largest number of records that AWS Lambda will retrieve from your table at the time of invoking your function. Your function receives an event with all the retrieved records.

100

Starting position

The position in the stream where AWS Lambda should start reading. For more information, see ShardIteratorType in the Amazon Kinesis API Reference.

Event sourcing: making it functional (1)

January 5, 2017 DDD, Event sourcing DDD, domain driven design, event sourcing

TL;DR

This article starts a series of entries that will guide you through my experiences with making event sourcing functional. There are a few existing entries about a functional approach to event sourcing, but I want to share my path and a story behind migrating from one approach to another. I'll start with some fundamentals. This will show from where I started, as well as it may help you to learn some basics of DDD and event sourcing if you're not into the topic.

```
public static IEnumerable<object> Receive(this PaymentState state, PaymentResponse response)
{
    if (response.Status == GatewayResponseStatus.OK)
    {
        yield return new PaymentProcessedSuccessfully();
    }
    else
    {
        yield return new PaymentProcessedWithFailure(response.ErrorDescription);
    }
}
```
